

Equilibrium Thermodynamics gives a comprehensive but concise course in the fundamentals of classical thermodynamics. Although the subject is essentially classical in nature, illustrative material is drawn widely from modern physics and free use is made of microscopic ideas to illuminate it. The overriding objective in writing the book was to achieve a clear exposition: to give an account of the subject that is both stimulating and easy to learn from. Classical thermodynamics has such wide application that it can be taught in many ways. The terms of reference for Equilibrium Thermodynamics are primarily those of the undergraduate physicist; but it is also suitable for courses in chemistry, engineering, materials science etc. The subject is usually taught in the first or second year of an undergraduate course, but the book takes the student to degree standard (and beyond). Prerequisites are elementary or school-level thermal physics.

In an isolated system when there is no change in the macroscopic property of the system like entropy, internal energy etc, it is said to be in thermodynamic equilibrium. The state of the system which is in thermodynamic equilibrium is determined by intensive properties such as temperature, pressure, volume etc.

Equilibrium Thermodynamics. Textbooks: primary: Herbert Callen's Thermodynamics and an Introduction to Thermostatistics. - secondary: Frederick Reif. Equilibrium: thermodynamics: Thermodynamic equilibrium: A particularly important concept is thermodynamic equilibrium, in which there is no tendency for the. Two objects separately in thermodynamic equilibrium with a third object are in Thermodynamics is a branch of physics which deals with the energy and work. This textbook provides an exposition of equilibrium thermodynamics and its applications to several areas of physics with particular attention to phase transitions. Equilibrium thermodynamics, as a subject in physics, considers macroscopic bodies of matter and energy in states of internal thermodynamic. The result is the analytical formulation of the non-equilibrium thermodynamics of interactions, named constructal, which can play the role of a "rallying point" of all. It is shown that the principal empirical laws of equilibrium thermodynamics can be brought into correspondence with the mathematical axioms of an abstract.
